

Amendments to the Abstract

Please **add** the following Abstract to this application.

-- The invention proposes a radio wave emission block intended to modify a satellite-based reception installation into a cheaper emission/reception installation. The emission block comprises a first input/output terminal and a second input/output terminal electrically linked to the first input/output terminal by way of a band rejection filter which rejects the intermediate emission frequency band. The invention also pertains to a transmission device comprising a reception block coupled with the emission block. --
